Lost In Transition: Challenges and Opportunities

Robert A. Berenson, M.D., F.A.C.P.
Senior Fellow, the Urban Institute
National Health Policy Forum
Washington, D.C., 7 October 2004
Where Does the Topic Belong?

• It’s part of medical errors/patient safety, but the p.s. focus has been intra-institutional
• It’s part of care coordination, but c.c. (e.g., disease management) has focused on longitudinal, mostly ambulatory care
• Transitions happen in “real time,” often with staff unfamiliar with the patient
Particular Challenges to High Quality Transition Care

- Patient
- Practitioner
- Health care institution
- Health information technology
- Performance measurement
- PAYMENT SYSTEMS
- Regulatory requirements and oversight
Why Payment is a Barrier

• Current payment approaches give little incentive for collaboration across sites of care, reinforcing “silos” of care

• Similarly, payment approaches exert no penalties to poor transitions
  – No reduced payment for readmissions
  – No CPT code captures the activities that foster a proper transfer/discharge
Regulatory Requirements Focus On Settings, Not Patients

• Different assessment instruments in different types of facilities, e.g., MDS for nursing home patients, OASIS for home health patients

• Accreditation and certification programs focus on structural elements of discharge planning within institution under review
Elements of a Change Agenda

Most important is the need to recognize that this is a unique domain of care that deserves its own research and policy focus, albeit connected to patient safety, quality and care coordination activities.
A Change Agenda (cont.)

• Development of performance measurement, focused on process measures

• Improved regulatory oversight, emphasizing whether transitions were successful, using relevant performance measures

• New payment approaches, e.g., bundling, transition planning, pay for performance
